

DFM12 XL epoch 11: traceable training composition by language

Each cell: million rendered tokens (percentage of ALL epoch tokens / percentage of ALL epoch rows). Input + response + template; identity repeat 0. Dedicated family allocations are lower bounds, not a full semantic census.

Language/source block	Instr. follow.	Commonsense	Correction	Acceptability	Summary	Reading QA	Knowledge	NER	Sentiment	Mixed SFT	Other/mixed	Allocated total

Full sampled epoch: 117,000,690,762 tokens. Base DFM11: 103,215,092,251; DFM12 additions: 13,785,598,511.

A dash means unavailable family attribution, NOT zero training exposure. Language-row totals exclude unassigned-language sources.

Mixed SFT is broad instruction/chat supervision without a validated family split. Other/mixed includes translation, math/code, tool use, text transformations, general reasoning, and combined summary/rewrite. General reasoning is not automatically commonsense reasoning.

Bilingual translation tokens are not arbitrarily split between source and target languages. Unspecified Norwegian is not silently assigned to Bokmal or Nynorsk.

Inherited source attribution was recovered from the originating machine and reconciled against the sampled epoch. Broad sources still need semantic task labels; recovered provenance is not a claim that every conversation has been classified.

Exact per-source row, rendered-token and response-token counts, provenance, and classification rationale are in dfm12_training_composition.json. These allocations do not measure causal contribution to evaluation scores.

Error correction: recorded spelling and grammar corruptions

Identified sampled correction rows in the active DFM12 epoch. Counts are post-admission and sampling; mistake categories/counts require matching producer annotations.

Language	Correction rows	Spelling rows (% all)	Spell rules	Spell pairs	Spell tok. %	Grammar rows (% all)	Gram. rules	Gram. pairs	Gram. tok. %	0 errors %	1 error %	2 errors %	3 errors %	4+ errors %	Unknown %

The percentages in parentheses divide by ALL 284,380,704 sampled training rows, across all languages and tasks. They are row exposure percentages, not percentages of tokens.

Token percentages divide the full rendered tokens of affected correction rows by ALL 117,000,690,762 sampled tokens. They do not count only the misspelled/incorrect token spans.

The final six columns divide by identified correction rows in that language. Clean controls (0) and unknown annotation coverage remain in the denominator. A row with both spelling and grammar errors contributes to both coverage columns.

Rules = distinct producer rule IDs actually observed; pairs = distinct original edit span / corrupted edit span pairs. Neither is the number of linguistic phenomena, and neither is inferred from character edit distance.

Grammar uses an explicit morphology/syntax-label allowlist. Generic deletion/swap operations without such a label stay unclassified; spelling and grammar columns are therefore neither mutually exclusive nor exhaustive.

The mistake count is the number of recorded corruption operations, not a guarantee that every operation corresponds to exactly one human-perceived error. Multiple operations may share a linguistic cause.

Coverage follows identified correction components; embedded correction examples in broad instruction sources may remain unclassified. A dash is unknown, not zero. Missing or conflicting producer metadata is not treated as a clean sample. Recovered source provenance does not itself recover missing edit annotations.

Detailed counts, token-weighted exposure, producer taxonomy, exact source paths, hashes, and annotation coverage are recorded in dfm12_error_composition.json.
